### **Programming Machine Ethics**

Series: Studies in Applied Philosophy, Epistemology and Rational Ethics, Vol. 26

- ▶ **Presents novel perspectives in machine ethics**
- ▶ **Brings together fundamental issues in ethics and finely tuned computational techniques**
- ▶ **Discusses the moral dimension of multiple, interacting agents**
- ▶ **<Includes a foreword by Professor Selmer Bringsjord**

This book addresses the fundamentals of machine ethics. It discusses abilities required for ethical machine reasoning and the programming features that enable them. It connects ethics, psychological ethical processes, and machine implemented procedures. From a technical point of view, the book uses logic programming and evolutionary game theory to model and link the individual and collective moral realms. It also reports on the results of experiments performed using several model implementations.

Opening specific and promising inroads into the *terra incognita* of machine ethics, the authors define here new tools and describe a variety of program-tested moral applications and implemented systems. In addition, they provide alternative readings paths, allowing readers to best focus on their specific interests and to explore the concepts at different levels of detail.

Mainly written for researchers in cognitive science, artificial intelligence, robotics, philosophy of technology and engineering of ethics, the book will also be of general interest to other academics, undergraduates in search of research topics, science journalists as well as science and society forums, legislators and military organizations concerned with machine ethics.
